This paper presents the work in EGEE-II on Grid Services Security Vulnerability and Risk Analysis. The majority of the work involves tackling specific Grid Security vulnerability issues, which are identified by various individuals. We will describe the process of handling issues, along with the risk assessment strategy, and the setting of a target date for resolution according to risk. The planned move towards a responsible public disclosure policy and the reasoning for this will also be explained. We will also briefly describe other activities in EGEE-II, such as vulnerability testing, of ensuring that the grid becomes more secure as time progresses.
